

Observability with elastic

The innovation enablers

Agenda

- Introduction
- Observability using elastic – why?
- Elastic ecosystem
- Application performance monitoring
- Log centralization
- Cluster monitoring

01

Introduction

„Who the hell are you?!“

Marek Hornák

Software/Data/DevOps engineer @ ableneo

02

Observability using elastic

Why?

Why elastic stack?

- Opensource or free
- Fast and reliable
- Heavily used in world – good support
- Simple to install and operate (excluding perf. tuning :-)
- Whole ecosystem of components which play nicely together
- Most organizations already use elasticsearch

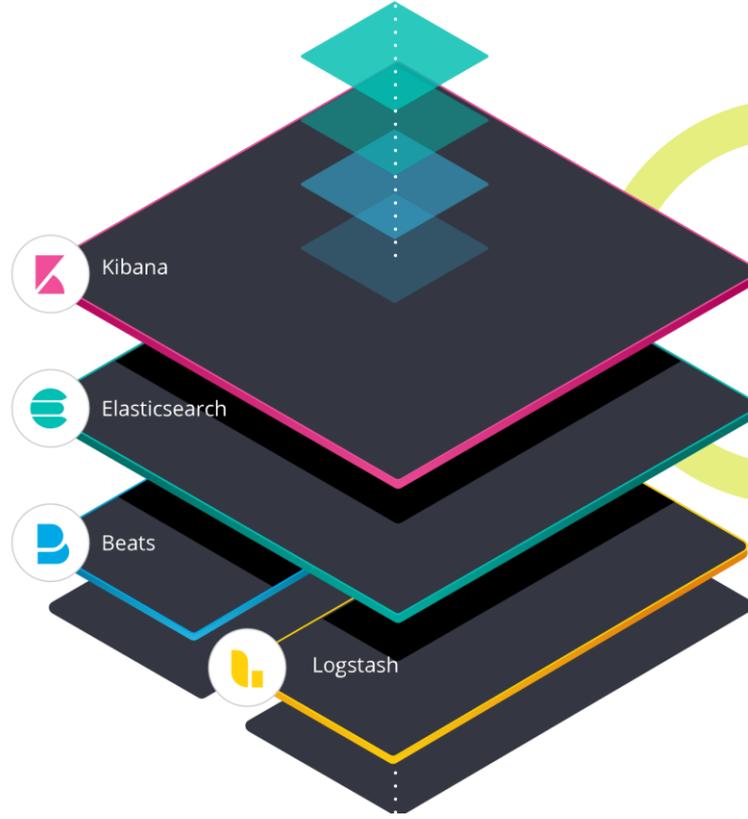

03

Elastic ecosystem

How?

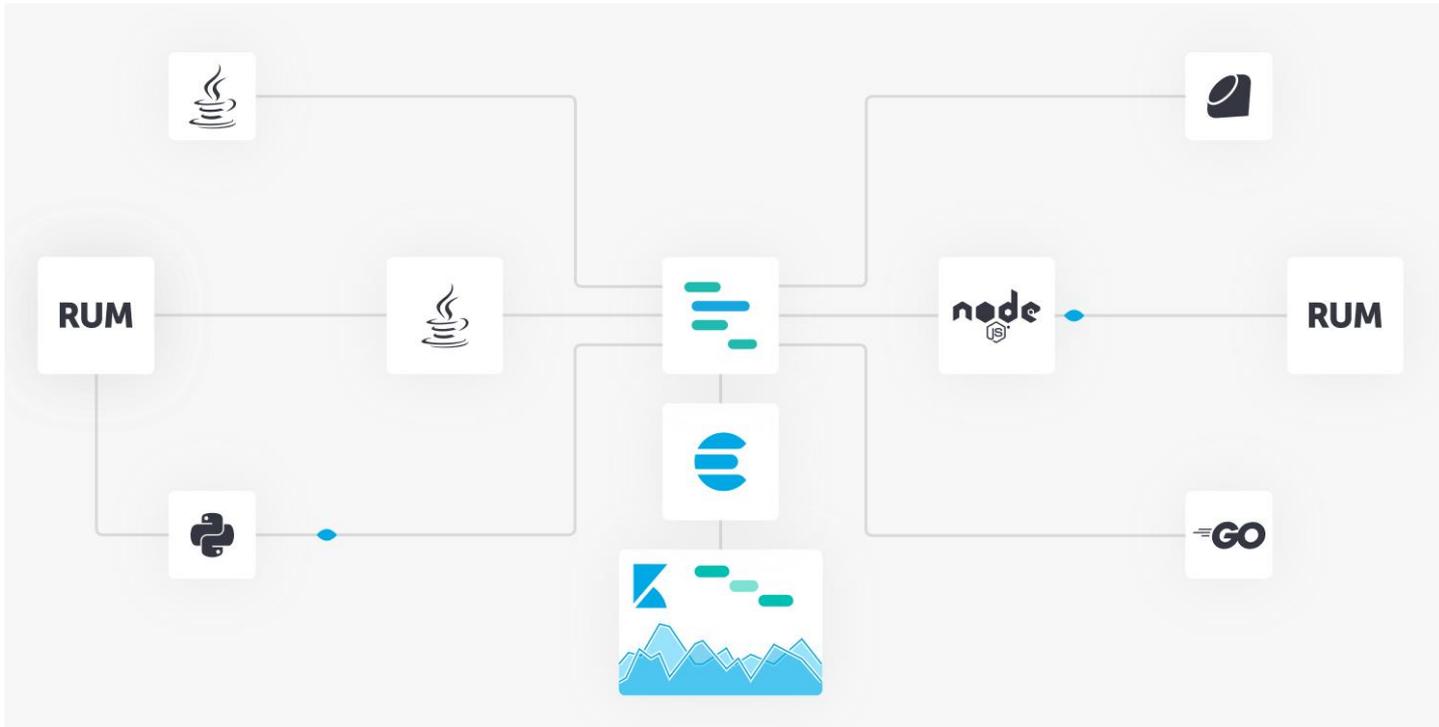

ELK stack

ELK stack with APM

04

Elastic APM

App insights in elastic

Elastic APM

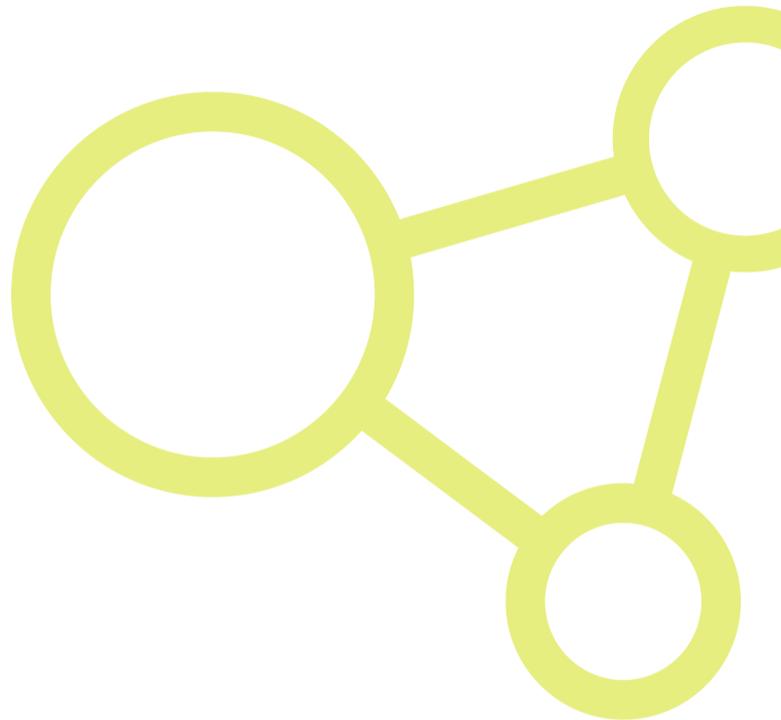

- Monitoring of distributed apps
- Transactions – from first request to last response
- Spans – are part of transaction – single action duration
 - DB query, REST call, code block...
- Kibana APM UI

Elastic APM

Supported technologies:

- Java
- Node.js
- Django
- Rails
- Go

DEMO

Elastic APM

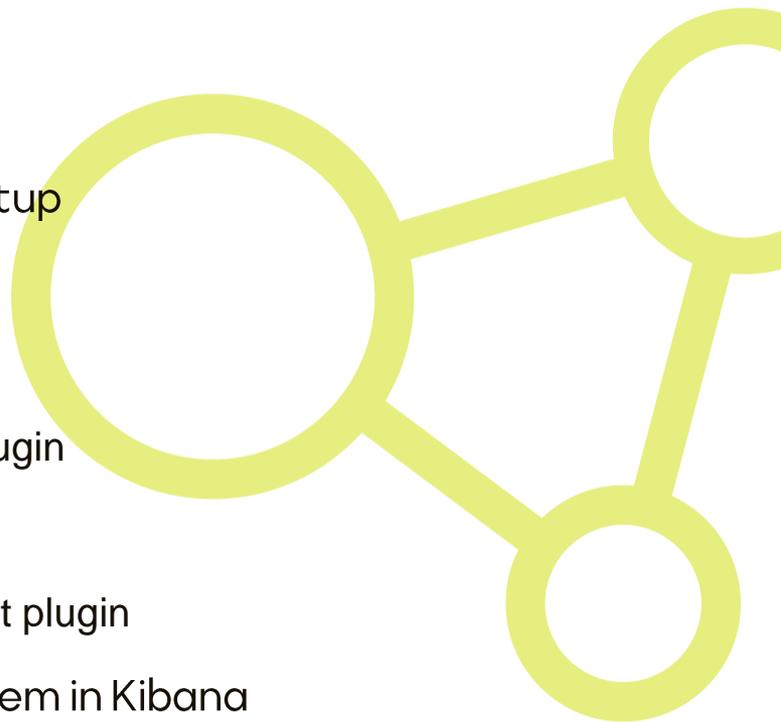

05

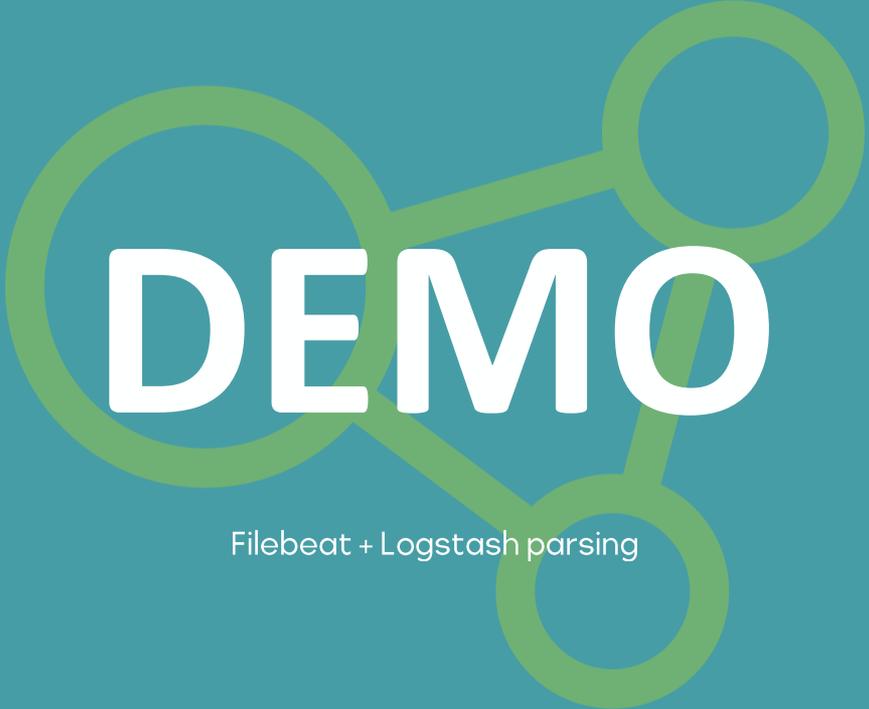

Log centralization

Logs in microservice era

Log centralization

- Use commercial service like logz.io – easy to setup
- Or send logs into elasticsearch – flexibility
- Deprecated approach:
 - Log4j socket appender + Logstash log4j input plugin
- Recommended approach:
 - Log to file, use Filebeat and Logstash beats input plugin
- Parse & enrich logs in Logstash and search in them in Kibana

DEMO

Filebeat + Logstash parsing

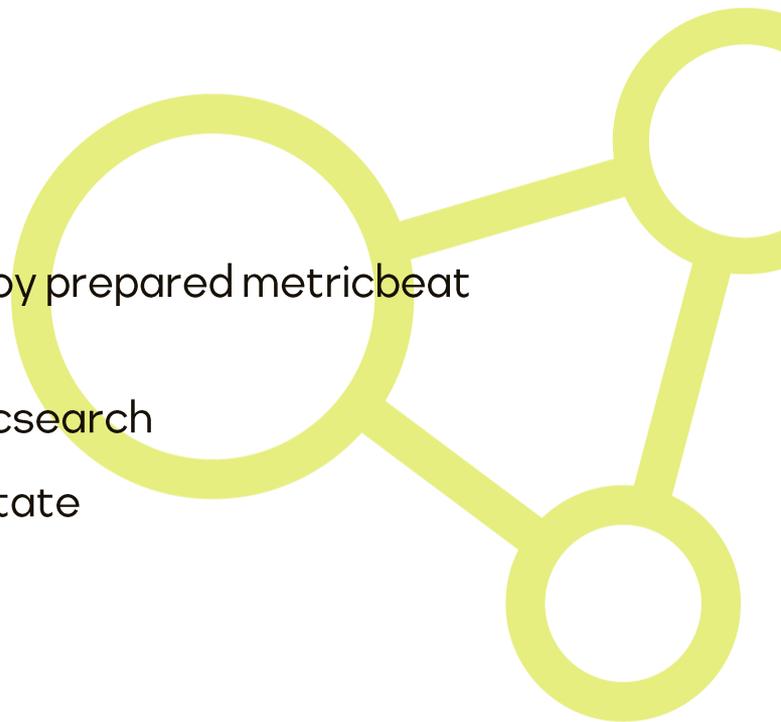

06

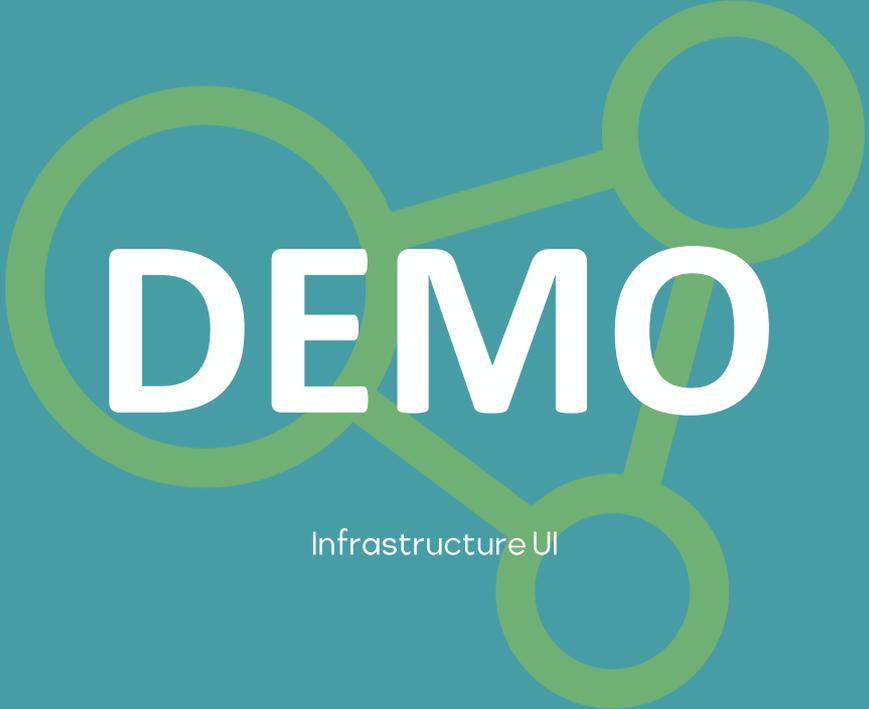

Cluster monitoring

Logs in microservice era

Cluster monitoring

- Metricbeats
- Kubernetes support – easy to install – just deploy prepared metricbeat deployment
- Metricbeats will then send statistics into elasticsearch
- Infrastructure UI in Kibana to visualize cluster state

DEMO

Infrastructure UI
